The nature of adaptation

Fossils

White beds contain fossilized tracks of vertebrate animals that lived about 260 million years ago.

Limestone accumulated in the oceans about 335 million years ago, burying marine animals and preserving their skeletons.

Slopes made of mud laid down in a shallow sea about 500 million years ago contain fossils of early arthropods called trilobites.

E. coli (see textbook)

At the first time point ($t = 0$), the numbers of ancestral and descendant bacteria are similar. The ratio is 1:1.

At the second time point ($t = 1$), there are greater numbers of descendant bacteria and fewer ancestral bacteria. The ratio is no longer 1:1.

- Species in the same geographic area (e.g., nearby islands) often seem to be closely related
- This is what we would expect if these species evolved independently, starting from a common ancestor in the region
- Support for the theory of evolution

Evolution and similarity

- In nature we observe many, often surprising, similarities between organisms

Evolution and similarity

- ▶ In nature we observe many, often surprising, similarities between organisms
 - ▶ Almost identical developmental genes in fruit flies and people

Evolution and similarity

- ▶ In nature we observe many, often surprising, similarities between organisms
 - ▶ Almost identical developmental genes in fruit flies and people
 - ▶ Similar limb bone structure in turtles and people

Evolution and similarity

- ▶ In nature we observe many, often surprising, similarities between organisms
 - ▶ Almost identical developmental genes in fruit flies and people
 - ▶ Similar limb bone structure in turtles and people
- ▶ The theory of evolution explains these similarities as **homologies**

Evolution and similarity

- ▶ In nature we observe many, often surprising, similarities between organisms
 - ▶ Almost identical developmental genes in fruit flies and people
 - ▶ Similar limb bone structure in turtles and people
- ▶ The theory of evolution explains these similarities as **homologies**

Homology

- A **homology** is a similarity that is due to common ancestry

Homology

- ▶ A **homology** is a similarity that is due to common ancestry
 - ▶ Similarities *apparently* due to homology are widespread. This is a strength of the theory of evolution.

Homology

- ▶ A **homology** is a similarity that is due to common ancestry
 - ▶ Similarities *apparently* due to homology are widespread. This is a strength of the theory of evolution.

Genetic homology

- **Genetic homology** is homology at the level of genetic coding.

Genetic homology

- ▶ **Genetic homology** is homology at the level of genetic coding.
- ▶ Examples:

Genetic homology

- ▶ **Genetic homology** is homology at the level of genetic coding.
- ▶ Examples:
 - ▶ The genetic code itself is shared (with rare, minor exceptions) by all living organisms

Genetic homology

- ▶ **Genetic homology** is homology at the level of genetic coding.
- ▶ Examples:
 - ▶ The genetic code itself is shared (with rare, minor exceptions) by all living organisms
 - ▶ Some genes involved in development are very similar all the way from insects to mammals

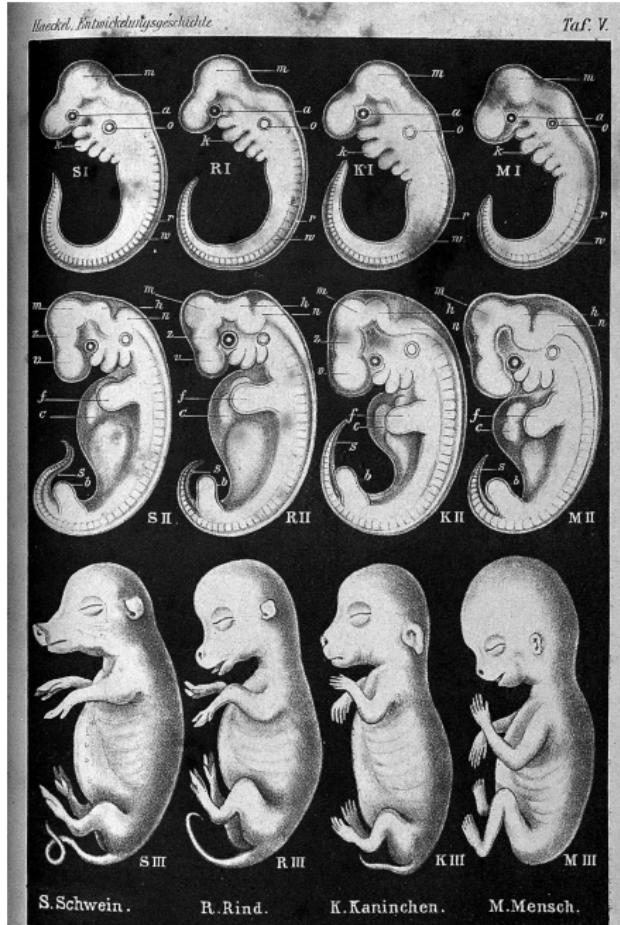

Genetic homology

- ▶ **Genetic homology** is homology at the level of genetic coding.
- ▶ Examples:
 - ▶ The genetic code itself is shared (with rare, minor exceptions) by all living organisms
 - ▶ Some genes involved in development are very similar all the way from insects to mammals
 - ▶ Genes from mice can cause frogs to grow eyes on their legs!

Genetic homology

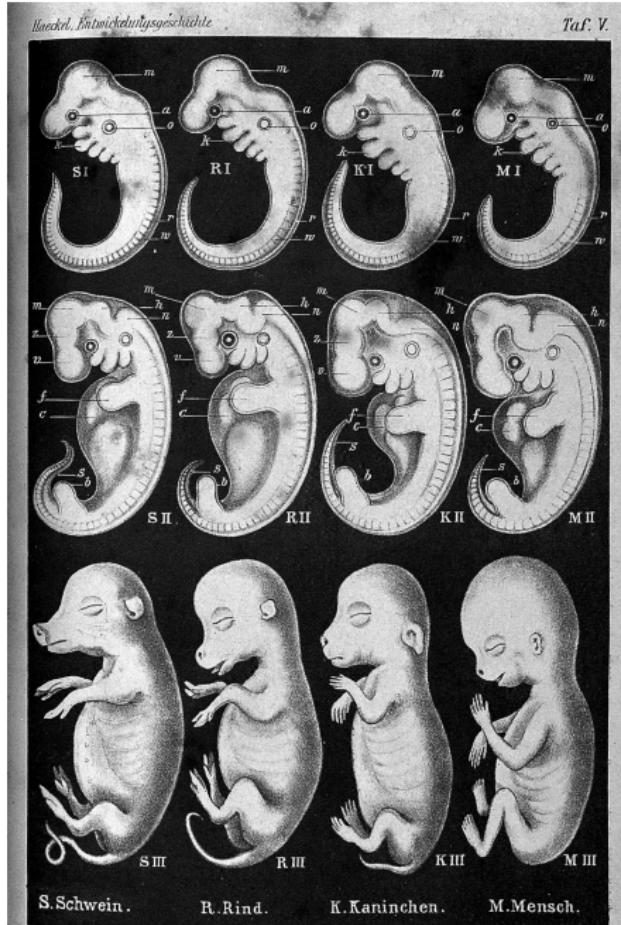

- ▶ **Genetic homology** is homology at the level of genetic coding.
- ▶ Examples:
 - ▶ The genetic code itself is shared (with rare, minor exceptions) by all living organisms
 - ▶ Some genes involved in development are very similar all the way from insects to mammals
 - ▶ Genes from mice can cause frogs to grow eyes on their legs!

Developmental homology

► **Developmental homology** is homology in the traits of **embryos** (developing organisms)

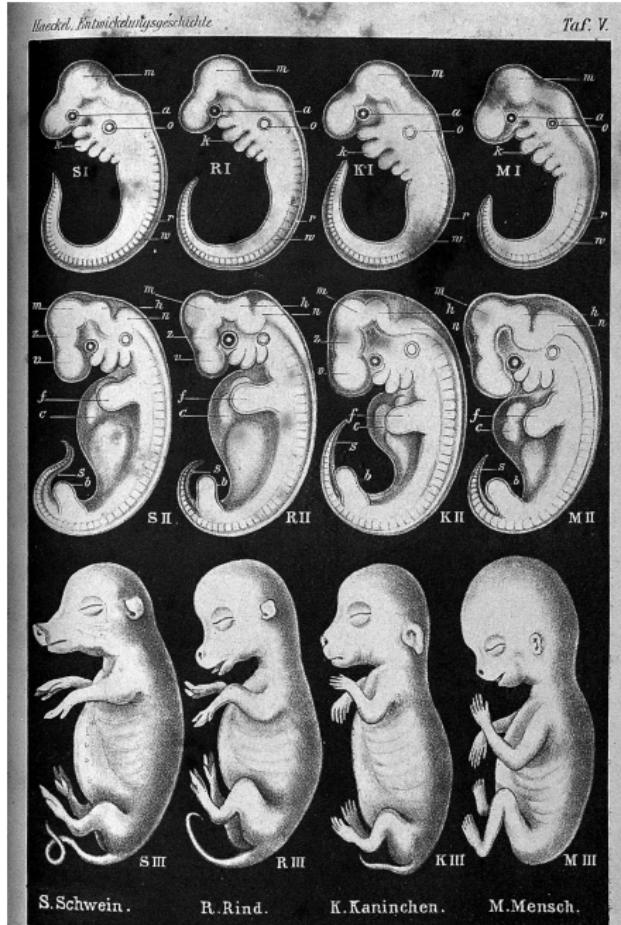

Developmental homology

► **Developmental homology** is homology in the traits of **embryos** (developing organisms)

► **Embryos of all vertebrates show striking similarities**

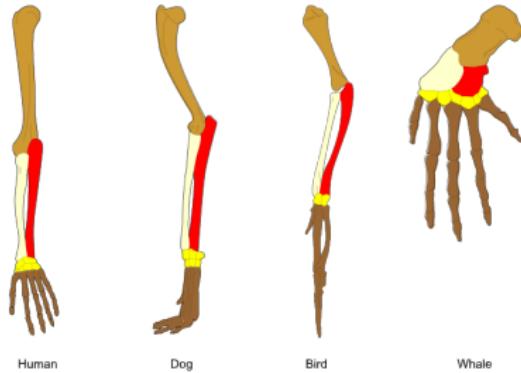

Developmental homology

► **Developmental homology** is homology in the traits of **embryos** (developing organisms)

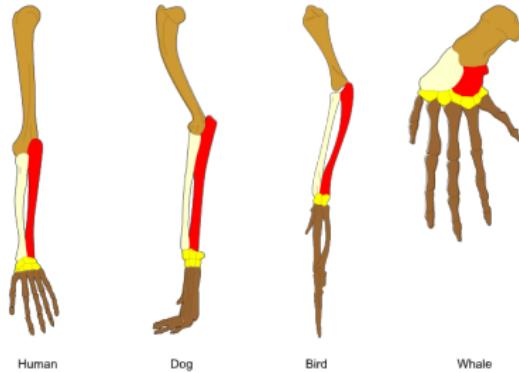

► Embryos of all vertebrates show striking similarities

Structural homology

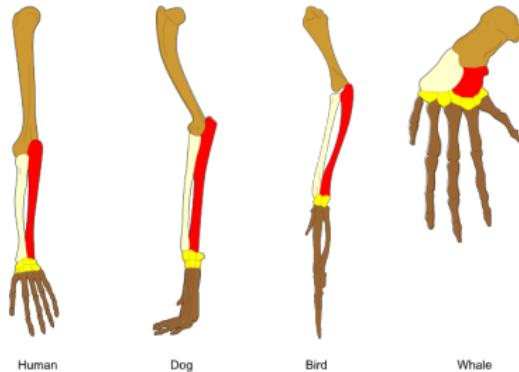

► **Structural homology** is homology at the level of developed organisms.

Structural homology

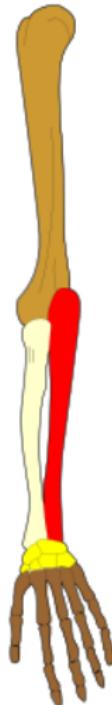

- ▶ **Structural homology** is homology at the level of developed organisms.
- ▶ **Tetrapod limbs**

Structural homology

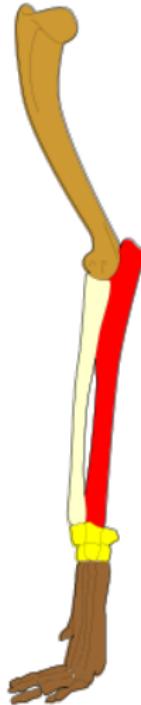

- ▶ **Structural homology** is homology at the level of developed organisms.
- ▶ Tetrapod limbs

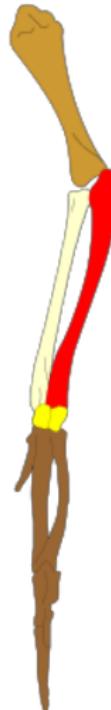

Tetrapod limbs

- ▶ What is **adaptation**?
 - ▶ Organisms evolving to become better suited to their environment
 - ▶ Includes physical environment and biological environment
 - ▶ Competing, eating and not being eaten ...

Natural selection drives evolution

- Darwin's theory of natural selection can be explained using four logical steps:

Natural selection drives evolution

- ▶ Darwin's theory of natural selection can be explained using four logical steps:
 - ▶ **Variation:** The individuals that make a population vary in the traits they possess, like size, shape, physiological details.

Natural selection drives evolution

- ▶ Darwin's theory of natural selection can be explained using four logical steps:
 - ▶ **Variation:** The individuals that make a population vary in the **traits** they possess, like size, shape, physiological details.
 - ▶ **Heritability:** Some of these differences can be inherited by offspring. For example, tall people may be more likely to produce tall offspring.

Natural selection drives evolution

- ▶ Darwin's theory of natural selection can be explained using four logical steps:
 - ▶ **Variation:** The individuals that make a population vary in the **traits** they possess, like size, shape, physiological details.
 - ▶ **Heritability:** Some of these differences can be inherited by offspring. For example, tall people may be more likely to produce tall offspring.
 - ▶ **Differential reproductive success:** In each generation, some organisms leave more offspring than others

Natural selection drives evolution

- ▶ Darwin's theory of natural selection can be explained using four logical steps:
 - ▶ **Variation:** The individuals that make a population vary in the **traits** they possess, like size, shape, physiological details.
 - ▶ **Heritability:** Some of these differences can be inherited by offspring. For example, tall people may be more likely to produce tall offspring.
 - ▶ **Differential reproductive success:** In each generation, some organisms leave more offspring than others
 - ▶ **Selection:** Reproductive success is not random, but is influenced by differences in traits, including heritable traits

Natural selection drives evolution

- ▶ Darwin's theory of natural selection can be explained using four logical steps:
 - ▶ **Variation:** The individuals that make a population vary in the **traits** they possess, like size, shape, physiological details.
 - ▶ **Heritability:** Some of these differences can be inherited by offspring. For example, tall people may be more likely to produce tall offspring.
 - ▶ **Differential reproductive success:** In each generation, some organisms leave more offspring than others
 - ▶ **Selection:** Reproductive success is not random, but is influenced by differences in traits, including heritable traits
- ▶ If all four of these assumptions hold, we expect evolution to occur . . .

Natural selection drives evolution

Fitness

- ▶ “Survival of the fittest” is not a very good name for this process

Fitness

- ▶ “Survival of the fittest” is not a very good name for this process
- ▶ **Fitness** in biology, or **Darwinian fitness**, means simply an ability to do well under natural selection

Fitness

- ▶ “Survival of the fittest” is not a very good name for this process
- ▶ **Fitness** in biology, or **Darwinian fitness**, means simply an ability to do well under natural selection
- ▶ Fitness is thus *defined* as average reproductive success, given a suite of heritable traits

Fitness

- ▶ “Survival of the fittest” is not a very good name for this process
- ▶ **Fitness** in biology, or **Darwinian fitness**, means simply an ability to do well under natural selection
- ▶ Fitness is thus *defined* as average reproductive success, given a suite of heritable traits
- ▶ Components of fitness:

Fitness

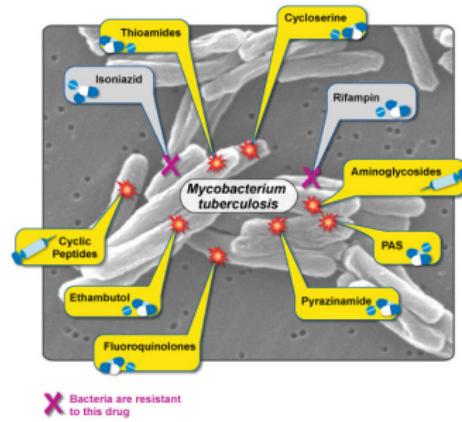

- ▶ “Survival of the fittest” is not a very good name for this process
- ▶ **Fitness** in biology, or **Darwinian fitness**, means simply an ability to do well under natural selection
- ▶ Fitness is thus *defined* as average reproductive success, given a suite of heritable traits
- ▶ Components of fitness:
 - ▶ survival, growth, reproduction

Fitness

- ▶ “Survival of the fittest” is not a very good name for this process
- ▶ **Fitness** in biology, or **Darwinian fitness**, means simply an ability to do well under natural selection
- ▶ Fitness is thus *defined* as average reproductive success, given a suite of heritable traits
- ▶ Components of fitness:
 - ▶ survival, growth, reproduction

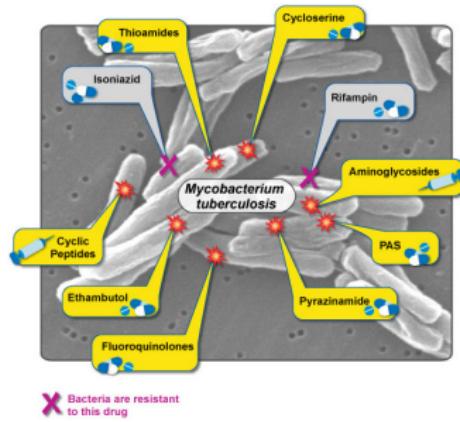

Example: Tuberculosis

► What if there were no variation?

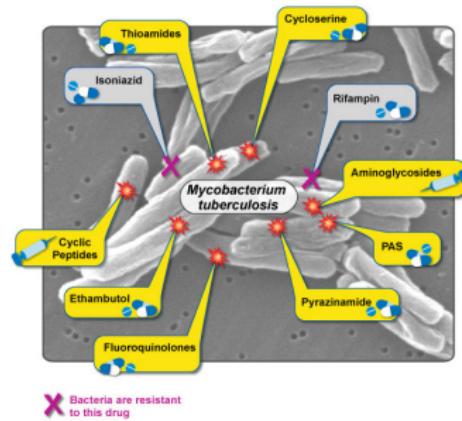

Example: Tuberculosis

- ▶ What if there were no variation?
 - ▶ Where does variation come from?

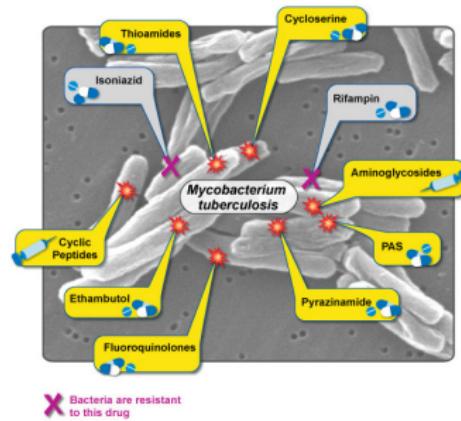

Example: Tuberculosis

- ▶ What if there were no variation?
 - ▶ Where does variation come from?
- ▶ What if variation were not heritable?

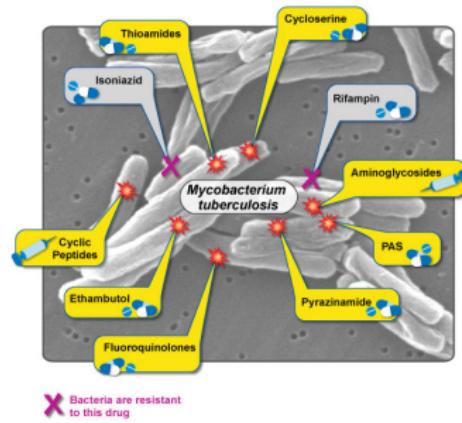

Example: Tuberculosis

- ▶ What if there were no variation?
 - ▶ Where does variation come from?
- ▶ What if variation were not heritable?
- ▶ What if there were no selection?

Example: Tuberculosis

- ▶ What if there were no variation?
 - ▶ Where does variation come from?
- ▶ What if variation were not heritable?
- ▶ What if there were no selection?

Finch beaks (see textbook)

Outline

Evolution

Change through time

Relationships between species

Natural selection

The nature of adaptation

Other models

- ▶ Natural selection is not the only possible model for how adaptive evolution could occur

Other models

- ▶ Natural selection is not the only possible model for how adaptive evolution could occur
 - ▶ Inheritance of acquired characteristics (Lamarck)

Other models

- ▶ Natural selection is not the only possible model for how adaptive evolution could occur
 - ▶ Inheritance of acquired characteristics (Lamarck)
 - ▶ Goal-directed evolution

Other models

- ▶ Natural selection is not the only possible model for how adaptive evolution could occur
 - ▶ Inheritance of acquired characteristics (Lamarck)
 - ▶ Goal-directed evolution

Inheritance of acquired characteristics

- This is the idea that individuals change in response to their environment, and pass those changes on to their offspring

Inheritance of acquired characteristics

- ▶ This is the idea that individuals change in response to their environment, and pass those changes on to their offspring
 - ▶ Giraffes reaching for food

Inheritance of acquired characteristics

- ▶ This is the idea that individuals change in response to their environment, and pass those changes on to their offspring
 - ▶ Giraffes reaching for food
 - ▶ Antelopes running away from lions

Inheritance of acquired characteristics

- ▶ This is the idea that individuals change in response to their environment, and pass those changes on to their offspring
 - ▶ Giraffes reaching for food
 - ▶ Antelopes running away from lions
- ▶ It is now known that while individuals do often change in response to their environment, such changes are not (usually) passed on to offspring

Inheritance of acquired characteristics

- ▶ This is the idea that individuals change in response to their environment, and pass those changes on to their offspring
 - ▶ Giraffes reaching for food
 - ▶ Antelopes running away from lions
- ▶ It is now known that while individuals do often change in response to their environment, such changes are not (usually) passed on to offspring
 - ▶ *We even more recently know that sometimes this can happen, but it's not the main way that evolution proceeds*

Inheritance of acquired characteristics

- ▶ This is the idea that individuals change in response to their environment, and pass those changes on to their offspring
 - ▶ Giraffes reaching for food
 - ▶ Antelopes running away from lions
- ▶ It is now known that while individuals do often change in response to their environment, such changes are not (usually) passed on to offspring
 - ▶ *We even more recently know that sometimes this can happen, but it's not the main way that evolution proceeds*
 - ▶ *Lamarck is now mostly known for being wrong about this, but he was an influential supporter of evolution*

Inheritance of acquired characteristics

- ▶ This is the idea that individuals change in response to their environment, and pass those changes on to their offspring

 - ▶ Antelopes running away from lions
- ▶ It is now known that while individuals do often change in response to their environment, such changes are not (usually) passed on to offspring
 - ▶ *We even more recently know that sometimes this can happen, but it's not the main way that evolution proceeds*
 - ▶ *Lamarck is now mostly known for being wrong about this, but he was an influential supporter of evolution*

Goal-directed evolution

- ▶ This is the idea that organisms evolve towards specific goals

Goal-directed evolution

- ▶ This is the idea that organisms evolve towards specific goals
 - ▶ Complex, multicellular organisms

Goal-directed evolution

- ▶ This is the idea that organisms evolve towards specific goals
 - ▶ Complex, multicellular organisms
 - ▶ Big-brained humans

Goal-directed evolution

- ▶ This is the idea that organisms evolve towards specific goals
 - ▶ Complex, multicellular organisms
 - ▶ Big-brained humans
- ▶ If the organism is moving toward a goal, it should move more or less in that direction all the time

Goal-directed evolution

- ▶ This is the idea that organisms evolve towards specific goals
 - ▶ Complex, multicellular organisms
 - ▶ Big-brained humans
- ▶ If the organism is moving toward a goal, it should move more or less in that direction all the time

Evaluating competing hypotheses

- We challenge hypotheses with experiments and observation

Evaluating competing hypotheses

- ▶ We challenge hypotheses with experiments and observation

Inheritance of acquired characteristics

- ▶ Raise a population of mice in the lab

Inheritance of acquired characteristics

- ▶ Raise a population of mice in the lab
- ▶ Every generation stretch (or chop off) their poor little tails

Inheritance of acquired characteristics

- ▶ Raise a population of mice in the lab
- ▶ Every generation stretch (or chop off) their poor little tails
- ▶ Measure natural tail length at the beginning of the experiment, and after 100 generations.

Inheritance of acquired characteristics

- ▶ Raise a population of mice in the lab
- ▶ Every generation stretch (or chop off) their poor little tails
- ▶ Measure natural tail length at the beginning of the experiment, and after 100 generations.
- ▶ How could this experiment be improved?

Inheritance of acquired characteristics

- ▶ Raise a population of mice in the lab
- ▶ Every generation stretch (or chop off) their poor little tails
- ▶ Measure natural tail length at the beginning of the experiment, and after 100 generations.
- ▶ How could this experiment be improved?
 - ▶ *

Inheritance of acquired characteristics

- ▶ Raise a population of mice in the lab
- ▶ Every generation stretch (or chop off) their poor little tails
- ▶ Measure natural tail length at the beginning of the experiment, and after 100 generations.
- ▶ How could this experiment be improved?
 - ▶ * Add a control group

Goal-directed evolution

- There is a great deal of observational evidence against goal-directed evolution:

Goal-directed evolution

- ▶ There is a great deal of observational evidence against goal-directed evolution:
 - ▶ **Vestigial traits**

Goal-directed evolution

- ▶ There is a great deal of observational evidence against goal-directed evolution:
 - ▶ Vestigial traits
 - ▶ Bidirectional evolution

Goal-directed evolution

- ▶ There is a great deal of observational evidence against goal-directed evolution:
 - ▶ Vestigial traits
 - ▶ Bidirectional evolution
 - ▶ Finch beaks get larger, then smaller

Goal-directed evolution

- ▶ There is a great deal of observational evidence against goal-directed evolution:
 - ▶ Vestigial traits
 - ▶ Bidirectional evolution
 - ▶ Finch beaks get larger, then smaller
 - ▶ Birds gain, then lose, flying ability

Goal-directed evolution

- ▶ There is a great deal of observational evidence against goal-directed evolution:
 - ▶ Vestigial traits
 - ▶ Bidirectional evolution
 - ▶ Finch beaks get larger, then smaller
 - ▶ Birds gain, then lose, flying ability
 - ▶ **Some organisms gain complexity and then lose it again**

Goal-directed evolution

- ▶ There is a great deal of observational evidence against goal-directed evolution:
 - ▶ Vestigial traits
 - ▶ Bidirectional evolution
 - ▶ Finch beaks get larger, then smaller
 - ▶ Birds gain, then lose, flying ability
 - ▶ Some organisms gain complexity and then *lose* it again

Adaptation vs. acclimation

- **Acclimation** is the ability of organisms to respond directly to their environment

Adaptation vs. acclimation

- ▶ **Acclimation** is the ability of organisms to respond directly to their environment
 - ▶ When organisms **acclimate** this does not affect the traits of their offspring

Adaptation vs. acclimation

- ▶ **Acclimation** is the ability of organisms to respond directly to their environment
 - ▶ When organisms **acclimate** this does not affect the traits of their offspring
- ▶ **Adaptation** is genetic change that increases the fitness of organisms

Adaptation vs. acclimation

- ▶ **Acclimation** is the ability of organisms to respond directly to their environment
 - ▶ When organisms **acclimate** this does not affect the traits of their offspring
- ▶ **Adaptation** is genetic change that increases the fitness of organisms
 - ▶ Adaptation does not occur as a direct response to the environment

Adaptation vs. acclimation

- ▶ **Acclimation** is the ability of organisms to respond directly to their environment
 - ▶ When organisms **acclimate** this does not affect the traits of their offspring
- ▶ **Adaptation** is genetic change that increases the fitness of organisms
 - ▶ Adaptation does not occur as a direct response to the environment
 - ▶ Adaptation is usually very slow

Adaptation vs. acclimation

- ▶ **Acclimation** is the ability of organisms to respond directly to their environment
 - ▶ When organisms **acclimate** this does not affect the traits of their offspring
- ▶ **Adaptation** is genetic change that increases the fitness of organisms
 - ▶ Adaptation does not occur as a direct response to the environment
 - ▶ Adaptation is usually very slow
 - ▶ **Adaptations are passed on to offspring, and form the basis of evolutionary change**

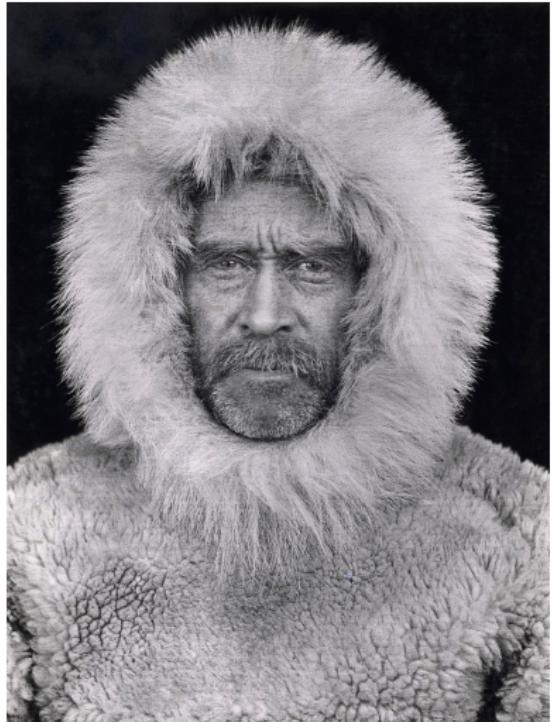

Adaptation vs. acclimation

- ▶ **Acclimation** is the ability of organisms to respond directly to their environment

Vertebrate blind spot

Evolution by natural selection – Summary

- There is strong evidence that species have evolved through time

Evolution by natural selection – Summary

- ▶ There is strong evidence that species have evolved through time
 - ▶ Fossil record, patterns of relatedness, homologies

Evolution by natural selection – Summary

- ▶ There is strong evidence that species have evolved through time
 - ▶ Fossil record, patterns of relatedness, homologies
- ▶ There is strong evidence that this change is driven by natural selection

Evolution by natural selection – Summary

- ▶ There is strong evidence that species have evolved through time
 - ▶ Fossil record, patterns of relatedness, homologies
- ▶ There is strong evidence that this change is driven by natural selection
 - ▶ Darwin's logical postulates: heritable variation in traits; differential reproductive success based on traits

Evolution by natural selection – Summary

- ▶ There is strong evidence that species have evolved through time
 - ▶ Fossil record, patterns of relatedness, homologies
- ▶ There is strong evidence that this change is driven by natural selection
 - ▶ Darwin's logical postulates: heritable variation in traits; differential reproductive success based on traits
 - ▶ Direct observations of natural selection (TB, finches)

Evolution by natural selection – Summary

- ▶ There is strong evidence that species have evolved through time
 - ▶ Fossil record, patterns of relatedness, homologies
- ▶ There is strong evidence that this change is driven by natural selection
 - ▶ Darwin's logical postulates: heritable variation in traits; differential reproductive success based on traits
 - ▶ Direct observations of natural selection (TB, finches)
 - ▶ Experiments with artificial selection and other manipulations

Evolution by natural selection – Summary

- ▶ There is strong evidence that species have evolved through time
 - ▶ Fossil record, patterns of relatedness, homologies
- ▶ There is strong evidence that this change is driven by natural selection
 - ▶ Darwin's logical postulates: heritable variation in traits; differential reproductive success based on traits
 - ▶ Direct observations of natural selection (TB, finches)
 - ▶ Experiments with artificial selection and other manipulations
- ▶ Natural selection by (gradual) evolution imposes important constraints

Evolution by natural selection – Summary

- ▶ There is strong evidence that species have evolved through time
 - ▶ Fossil record, patterns of relatedness, homologies
- ▶ There is strong evidence that this change is driven by natural selection
 - ▶ Darwin's logical postulates: heritable variation in traits; differential reproductive success based on traits
 - ▶ Direct observations of natural selection (TB, finches)
 - ▶ Experiments with artificial selection and other manipulations
- ▶ Natural selection by (gradual) evolution imposes important constraints
 - ▶ Species are not perfectly adapted

Evolution by natural selection – Summary

- ▶ There is strong evidence that species have evolved through time
 - ▶ Fossil record, patterns of relatedness, homologies
- ▶ There is strong evidence that this change is driven by natural selection
 - ▶ Darwin's logical postulates: heritable variation in traits; differential reproductive success based on traits
 - ▶ Direct observations of natural selection (TB, finches)
